"Amino acid sequences of haemagglutinins of influenza viruses c
"Amino acid sequences of haemagglutinins of influenza viruses c
"H3 subtype isolated from horses.";

J. Gen. Virol. 66:457-464(1985).

-I- FUNCTION: HEMAGGLUTININ IS RESPONSIBLE FOR ATTACHING THE VI
CELL RECEPTORS AND FOR INITIATING INFECTION.

-I- SUBJULT: HOMOTRIMER. EACH OF THE MONOMER IS FORMED BY TWO C
(HAI AND HA2) LINKED BY A DISULFIDE BOND.

-I- SIMILARITY: BELONGS TO THE INFLUENZA HEMAGGLUTININ FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CARBOHYD

- I FUNCTION: MYOSIN IS A PROTEIN THAT BINDS TO F-ACTIN & HAS ATPAS ACTIVITY THAT IS ACTIVATED BY F-ACTIN.
- I SUBUNIT: MUSCLE MYOSIN IS A HEXAMERIC PROTEIN THAT CONSISTS OF HEAVY CHAIN SUBUNITS (MHC), 2 ALKALI LIGHT CHAIN SUBUNITS (MLC) AND 2 REGULATORY LIGHT CHAIN SUBUNITS (MLC-2).
- I SUBCELLULAR LOCATION: THICK FILAMENTS OF THE MYOFIBRILS.
- I SIMILARITY: CONTAINS 1 10 DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               "Structure of the regulatory domain of scallop myosin at resolution: implications for regulation."; Structure 4:21-32(1996).

                                                                                                                                                                                                                                                                                                                                                                                                                          Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The CC mutant cmpF gene (AAZ2888) was used in the production of a bacterium CC attenuated by a non-reverting mutation in each of the ompF gene, the aroC gene (AAZZ2883, AAZZ2884), and the ompC gene (AAZZ2885, AAZZ2886). The CC mutant bacteria provide immunogenic activity with reduced virulence and CC thus can be used as a vaccine for raising an immune response against a CC variety of bacteria in a mammalian host. Such vaccines can provide CC protection against e.g., E. coli (a cause of diarrhoea in humans). CC Salmonella typhimurium (the cause of salmonellosis in several animal CC species), S. typhi (the cause of salmonellosis in several animal CC of food poisoning in humans), S. choleraesuis (a cause of salmonellosis in pigs), S. dublin (a cause of both a systemic and diarrhoeal disease in CC of meningitis), Neisseria gonorrhoeae (a cause of gonorrhoeae), Yersinia CC from gastroenteritis to fatal septicaemic disease), Bordetella pertussis (the cause of whooping cough), and Brucella abortus (a cause of abortion and infertility in cattle and a condition known as undulant fever in
                                                                                                                                                                                                                                                                                                                                                  õ
                                                                                                                                                                                                                                                                                                                                                                                    밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel method for predicting the tendency of a protein to form either: (a) an amphiphilic alpha-structure or (b) an amphiphilic beta-structure. The methods are used particularly for predicting the structure of membrane proteins such as glucose transporter proteins (GLUTS). They can be used to discern the function of proteins. They can also be used for the rational design or identification of compounds which interact with the proteins or to engineer proteins having particular structures. This sequence represents an Escherichia coli ompf porin which is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Predicting tendency to form amphiphilic alpha and beta structures using a novel algorithm to calculate values for subsequent graphical analysis to predict protein structure  \begin{array}{c} \\ \\ \\ \\ \\ \end{array}

CC This sequence represents the E. coll wild-type ompC protein. The coding CC sequence of the ompC gene was removed via PCR using primers TT7-TT10 CC (AAX22893-Z22896) to produce a non-reverting deletion mutation. The CC mutant ompC gene (AAX22886) was used in the production of a bacterium CC attenuated by a non-reverting mutation in each of the ompC gene, the arcC gene (AAX22883, AAX22884), and the ompF gene (AAX22887, AAX22888). The CC mutant bacteria provide immunogenic activity with reduced virulence and CC thus can be used as a vaccine for raising an immune response against a CC variety of bacteria in a mammalian host. Such vaccines can provide CC protection against e.g., E. coll (a cause of diarrhoea in humans), CC Salmonella typhimurium (the cause of salmonellassis in several animal CC species), S. typhi (the cause of salmonellosis in several animal CC of food poisoning in humans), S. choleraesuis (a cause of salmonellosis in pigs), S. dublin (a cause of both a systemic and diarrhoeal disease in CC of meningitis), Neisseria gonorrhoeae (a cause of gonorrhoeae), Yersinia CC enterocolitica (the cause of a spectrum of disease in humans ranging CC from gastroenteritis to fatal septicaemic disease in humans ranging CC the cause of whooping cough), and Brucella abortus (a cause of abortion CC bumans) and cause of abortion and infertility in cattle and a condition known as undulant fever in

The novel CC method of diagnosing UC in a subject suspected of having inflammatory CC bowel disease (IBD) comprises: (1) obtaining a sample from the subject; CC (2) contacting the sample with a histone H1-like antigen, or perinuclear CC anti-neutrophil cytoplasmic antibody (pANCA)-reactive fragment, to form a CC complex of the histone H1-like antigen, or the pANCA-reactive fragment, CC and antibody to the histone H1-like antigen; and (3) detecting the presence or absence of the complex; where the presence of the complex CC indicates that the subject has UC. The pANCA-reactive histone H1-like antigen; and (3) reactive histone H1-like cCC diagnosis, prevention and bacteroides antigen are useful in the CC diagnosis, prevention and treatment of UC. The methods can also be used CC crepresents a E. coli outer membrane protein c precursor.

                                                                                                                       The invention provides a method for diagnosing ulcerative colitis in a subject suspected of having inflammatory bowel disease. The method comprises reacting a patient sample with a porin antigen that is immunologically reactive with paNCA (perinuclear anti-neutrophil cytoplasmic antibodies) and detecting formation of a Ag-pANCA complex as indicative of ulcerative colitis. The method is used to diagnose ulcerative colitis or susceptibility to it. The present sequence represents a E. coll outer membrane protein c precursor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
    The invention provides a method for the diagnosis, prevention and treatment of ulcerative colitis (UC) using histone H1-like antigen, a CC treatment of ulcerative colitis (UC) using histone H1-like antigen. A CC porin antigen or a Bacteroides antigen as a target antigen. The novel comethod of diagnosing UC in a subject suspected of having inflammatory CC protecting the sample with a histone H1-like antigen, or perinuclear CC (2) contacting the sample with a histone H1-like antigen, or perinuclear CC complex of the histone H1-like antigen, or the pawCa-reactive fragment, to form a CC complex of the histone H1-like antigen, or the pawCa-reactive fragment, CC and antibody to the histone H1-like antigen, or the pawCa-reactive fragment, CC indicates that the subject has UC. The pawCa-reactive histone H1-like antigen, porin antigen and Bacteroides antigen are useful in the CC diagnosis, prevention and treatment of UC. The methods can also be used CC for identifying agents useful for treating UC. The present sequence CC represents a E. coli outer membrane protein F precursor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ulcerative colitis; histone; H1-like antigen; porin antigen; Bacteroides antigen; IBD; pANCA; inflammatory bowel disease; diagnosis; perinuclear anti-neutrophil cytoplasmic antibody; outer membrane protein F precursor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAY34057

The method comprises reacting a patient sample with a porin antigen that is immunologically reactive with pANCA (perinuclear anti-neutrophil cytoplasmic antibodies) and detecting formation of a Ag-pANCA complex as indicative of ulcerative colitis. The method is used to diagnose ulcerative colitis or susceptibility to it. The present sequence represents a E. coll outer membrane protein F precursor.
                                                                                                                                                                                                   Ulcerative colitis; histone; H1-like antigen; porin antigen; Bacteroides antigen; IBD; pANCA; inflammatory bowel disease; diagnosis; perinuclear anti-neutrophil cytoplasmic antibody;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention provides a method for the diagnosis, prevention and Ctreatment of ulcerative colitis (UC) using histone H1-like antigen, a porin antigen or a Bacteroides antigen as a target antigen. The novel method of diagnosing UC in a subject suspected of having inflammatory bowel disease (IBD) comprises: (1) obtaining a sample from the subject; (2) contacting the sample with a histone H1-like antigen, or perinuclear anti-neutrophil cytoplasmic antibody (pANCA)-reactive fragment, to form a CC complex of the histone H1-like antigen, or the pANCA-reactive fragment, and antibody to the histone H1-like antigen; and (3) detecting the presence or absence of the complex; where the presence of the complex indicates that the subject has UC. The pANCA-reactive histone H1-like antigen, porin antigen and Bacteroides antigen are useful in the C alagnosis, prevention and treatment of UC. The methods can also be used for identifying agents useful for treating UC. The present sequence crepresents a E. coli outer membrane protein F precursor.

The method comprises reacting a patient sample with a porin antigen that is immunologically reactive with pANCA (perinuclear anti-neutrophil cytoplasmic antibodies) and detecting formation of a Ag-pANCA complex as indicative of ulcerative colitis. The method is used to diagnose ulcerative colitis or susceptibility to it. The present sequence represents a E. coli outer membrane protein F precursor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Diagnosing ulcerative colitis or susceptibility, by detecting formation between microbial porin antigen and perinuclear anti-neutrophil cytoplasmic autoantibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       12-APR-1996;

                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a Staphylococcus aureus protein, that, based on homology with an Escherichia coli protein, is believed to be a outer membrane protein F precursor. The DNA sequence was isolated from library of clones of S. aureus WCUH 29 in Escherichia coli. The DNA sequence can be used in the construction of ribozymes and antisense sequences to control the expression of Staphylococcal genes. The DNA sequence is also useful as a source of regulatory elements for the control of bacterial gene expression. The present protein may be used to produce vaccines to enable a host to produce specific antibodies with antibacterial action. These vaccines and antibodies would protect a host against invasion by S. aureus, and conditions relating to Staphylococcal infection, e.g. Staphylococcal food poisoning, scaled skin syndrome, and toxic shock syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Black MT,

They serve as molecular sieves that allow polar solutes to pass through, but excludes non-polar molecules of comparable sizes. This amino acid sequence shares a sequence homology of about 38% to Pasteurella multocida X-73 OmpH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI;

cc multocida x-73, outer membrane protein H (OmpH). This protein is a cc porin, which is a major outer membrane protein that is involved in correct formation. They serve as molecular sieves that allow polar solutes ct pass through, but excludes non-polar molecules of comparable sizes. The amino acid composition is typical of non-specific bacterial porins cwith highly negative hydropathy index, high glycine content, low proline content and lack of cysteine. This amino acid sequence shows homology of about 38% to bacterial porins, like that of H.influenzae porin P2. Cc Multiple antigen peptides are synthesised from the loop 2 and loop 5 cregions of the protein that can be used for immunisation of the fowls to induce heterologous protection against P.multocida infection. This sequence can be used for diagnostic assays for use in veterinary medicine, especially for the diagnosis of fowl cholera, caused by P.multocida. Peptides derived from the ompH protein are useful in the protective vaccines for use in vertebrates, in particular for the four contents of the course o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 10; Fig 4; 119pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The example concerns cloning of Class 2 porin from Group B

(Nelsseria meningitidis strain BNCW M986 serotype 2a (see

AAQ85300, AAQ85301). The plasmid pET-17b was used to express the

Class 2 porin. A plasmid was designed to yield a mature class 2

porin. The mature class 2 porin was constructed by amplifying

the pUC19 class 2 porin construct using the oligos AAQ85302 and

CAAQ85303. This strategy allowed the cloning of the amplified class 2

porin into the NdeI and XhoI sites of the plasmid pET-17b thus

producing mature class 2 porin. Std. PCR was conducted using the

UC19 class as the template and the two oligos. The PCR reaction

yielded a 1.1kb product. The DNA obtd. was purified and digested

with NdeI and XhoI and ligated to pET-17b, and used to transform

E.coli. DNA from transformed clones was sequenced. AAQ85391,R70763

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This protein comprises the mature class 3 porin (MB3) protein porB CC from group B Neisseria meningitidis, encoded by a mature class 3 CC porin gene (see AAT77815) in vector pET-24a and expressed in E. coli DH5-alpha transformants. A method is claimed for the high level capression of an outer membrane meningococcal group B porin protein CC in yeast. It comprises: ligating a DNA sequence encoding mature porin (see AAT77812), or mature porin fused to a scoretion signal CC sequence (see AAT77814), into a vector containing a selectable marker and a yeast promoter such as the AOX1 promoter; using the vector to CC and a yeast promoter such as the AOX1 promoter; using the vector to claimed for purifying the perin pastoris, host cells; and CC claimed for purifying the porin protein. The level of porin CC claimed for purifying the porin protein. The level of porin protein senhanced by optimising the 5' region of the porin protein expression is enhanced by optimising the 5' region of the porin protein gene for yeast codon usage (see AAT76738 and AAT77816).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match 8.7%; Score 157; DB 18; Length 342; Best Local Similarity 24.7%; Pred.
